**1RN19CS100**

Train arrival and departure is a computer graphics mini project. In this mini project, there are two modes which are day and night modes. It has objects like train, signal, and a railway station. There will be a train which will start arriving at the railway station when the signal light is green and it will stop at the railway station when the red light is turned on. The train will not move from the railway station till the user displays green light in the traffic signal, when the green light is turned on then the train will start to depart from the railway station.
